RE: Stetson, Bryce
DOB: 10/07/2004

Dear Dr. Yassin:

I had the pleasure of seeing your patient, Bryce, today in our pediatric cardiology office. As you know, Bryce is a 7-year-old male who is here for a murmur evaluation. He had seen a cardiologist in the Deborah Heart and Lung Center for a murmur last year. At that time, his echocardiogram was normal. Bryce is otherwise doing well. Mom does not report any signs or symptoms of cardiorespiratory compromise. He is very active. Family history is significant for a sibling who died of SIDS.

On physical exam, he is well appearing and not in distress. His height is 46 inches. Weight is 47 pounds. Blood pressure is 112/57, with a heart rate of 84 beats per minute. His lungs are clear. Cardiac exam reveals a regular rate and rhythm. Normal S1 with a physiologically split S2. There is a grade 2/6 systolic ejection murmur best heard at the left lower sternal border. There are no gallops, no clicks, no rubs. Abdomen is soft, nontender. No hepatomegaly. Extremities are warm and well perfused. Pulses are full and equal. No edema.

A 12-lead EKG was done and showed normal sinus rhythm with a heart rate of 81 beats per minute. There are no ST segment changes or T-wave inversions. The QTc is normal at 369 msec.

An echocardiogram with Doppler interrogation was done and showed good biventricular function with normal segmental anatomy. There are no significant septal defects seen. The shortening fraction is normal at 42%.

Stetson

It is my overall impression that Bryce is stable from a cardiac standpoint. His EKG and echocardiogram are normal. His murmur is functional nature. I discussed all these findings with the mother and reassured her. Bryce does not require any activity restrictions or SBE prophylaxis. I did request followup in 2 years for reevaluation.

Thank you very much for participating in his care. Please feel free to call if you have any further questions or concerns.

Sincerely,

12/16/2011 11:38:07 AM
