Magnetic Resonance • Computed Tomography • Mammography • Ultrasound • Radiography

**PATIENT NAME:** PAPA, ANDREW J  
**HOME PHONE NUMBER:** 6092421937  
**PATIENT NUMBER:** 147825  
**DOB:** 05/05/1995  
**EXAMINATION:** CT OF THE SOFT TISSUE NECK WITHOUT CONTRAST  
**DATE:** 11/29/2011  
**PHYSICIAN:** MAHMOUD M YASSIN, MD

**CLINICAL HISTORY:** SWELLING ALONG THE RIGHT SIDE SOFT TISSUES OF THE NECK.

**INTERPRETATION:** Noncontrast axial Computed Tomography of the soft tissues of the neck from the base of the skull to the thoracic inlet with reformatted sagittal and coronal images was completed. The intravenous injection of the iodine contrast material was not utilized as requested by the referring physician. Because of the non-utilization of intravenous contrast injection the examination is limited.

There is a mucosal thickening in both maxillary sinuses and left sphenoid sinus, consistent with chronic sinusitis. Also there is retention cyst in the left maxillary sinus.

The nasopharynx, oropharynx, hypopharynx, epiglottis and larynx are normal. The subglottic area of the proximal trachea is unremarkable. The nonenhanced images of the thyroid gland is unremarkable.

There are multiple tiny subcentimeter small lymph nodes in all zonal areas which is most likely reactive in nature.

There is no evidence for bulky lymphadenopathy.

The non-enhanced images of the salivary gland, bilaterally are unremarkable.

The area of swelling was marked by external marker and appeared to be overlying the anterior lateral aspect of the sternomastoid muscle which appeared to be slightly more prominent when compared to left side however there is no evidence for focal high attenuation or low attenuation in the muscle.

**IMPRESSION:** PATENCY OF THE ENTIRE UPPER AIRWAY.

NONSPECIFIC SUBCENTIMETER TINY LYMPH NODES WHICH MOST LIKELY REACTIVE IN NATURE.

NO EVIDENCE FOR PATHOLOGIC LYMPHADENOPATHY.
